

prompt engineering

python, Java

Analyze the data : poor prompt

best prompt:

→ Instruction + Context + Constraint

Instruction: what you want done

Context : background information needed

Constraint: Boundaries and requirements

Poor: "Explain cloud"

→ problem : no context, no constraints, vague instruction

Better: "Summarize AWS cloud services for a DevOps engineer in 3 concise bullets"

Instruction: summarize

Context: AWS cloud services, for devops engineer

Constraint: 3 bullets, concise.

Effective prompt:

- ① Role: sets domain expertise
- ② task: Defines what needs to be accomplished
- ③ Context: provide some necessary background
- ④ Constraint: set boundaries and requirements
- ⑤ output format: specify how to present results.

"you are a data scientist specializing in predictive modeling. Build a customer churn prediction model using the telecom dataset. Focus on features with correlation > 0.3 to churn. provide python code with sklearn and confusion matrix"

Role: task:

Role based prompting:

prompt chaining: Input → process → output

output → process → output

output
