

~~or other too~~
 Sequential can only predict one outcome such as regression & classification, but functional allows us to predict two outputs such as classification & regression.

Supervised Machine learning

x_1, x_2, x_3, x_n	Target	→ SL — classification
	a b c	

Every SL Algo can predict one target?
 G.S.O AM! What is the meaning of this

Functional → ^{Two} multiple targets.

x_1, x_2, x_3, x_n	Target 1	Target 2

When two targets are useful.

in ~~IoT~~ IoT devices we want to find out about sensor's health & we also want to identify ^{is there any abnormality in sensor} sensor life using some parameter. Another example diabetes if a person is diabetic ^(classification) what will be the glucose level. (Regression)
