

24 October 2025

Keras framework

Build three different ways.

- 1) Sequential
- 2) Functional API
- 3) Model subclassing

Model SUBCLASSING:

IN SEQUENTIAL -

```
Model = Sequential.  
model.add(Dense(—))  
model.add(Dense(—))  
" " " "
```

IN FUNCTIONAL API

```
input = Input(shape=(4,))  
l1 = Dense(8)(input)  
l2 = Dense(10)(l1)
```

~~but~~ Using functional we can predict two target. (it can also define more than two but in reality we build another model.)
