

28 October. DEEP LEARNING

Neural Networks with more layers & modules

Which kind of problems can be solved with DL

classical ML $\rightarrow$ Prediction

SV, Random classifier

These won't work for complex problem.

Deep learning

neurons $\rightarrow$ Perceptron

Data is non-linear, hierarchical, abstract representation of data.

Flexible model any input/output type & size

classical ML doesn't

Differentiable Functional Programming

higher order cannot be solved with

classical ML. $2x^2 + 3$ (16:58 see)

~~Best~~ Better algorithms & understanding.

Deep learning requires lots of processing and previously it was not possible. Hardware enhancement made it possible. hence DL is possible.
GPUs, TPUs
