

03 - NOVEMBER.

ONE MORE EXAMPLE ON CNN

CNN $\rightarrow$ Horses & Humans

or a human. Classify whether its a horse

Another one is where through web cam the image is captured to identify human vs to object (table, chair) $\rightarrow$ Keras - imageNet pre-train.

ANN $\rightarrow$ Convolution - max pooling - flatten.

How Convolution layers works

It is same as ANN but the hidden layers are replaced by Convolution, MaxPool and Flatten. Conv2D, MaxPool2D

CNN is trying to classify. For example it extract features such as ^{distance between} ear to nose, to classify images. ~~the~~

For example in IRIS DS we had features defined but with solid images convolution layers are used to identify features. ^{max pooling} & that
